The geometry package

Hideo Umeki
latexgeometry@gmail.com
2018/03/24 v5.7

Abstract
This package provides a flexible and easy interface to page dimensions. You can change the page layout with intuitive parameters. For instance, if you want to set a margin to 2cm from each edge of the paper, you can type just `\geometry{margin=2cm}`. The page layout can be changed in the middle of the document with `\newgeometry` command.

1 Preface to version 5

• Changing page layout mid-document.
The new commands `\newgeometry{···}` and `\restoregeometry` allow users to change page dimensions in the middle of the document. `\newgeometry` is almost similar to `\geometry` except that `\newgeometry` disables all the options specified in the preamble and skips the papersize-related options: `landscape`, `portrait` and paper size options (such as `papersize`, `paper=a4paper` and so forth).

• A new set of options to specify the layout area.
The options specified for the area, in which the page dimensions are calculated, are added: `layout`, `layoutsize`, `layoutwidth`, `layoutheight` and so forth. These options would help to print the specified layout to a different sized paper. For example, with `a4paper` and `layout=a5paper`, the geometry package uses ‘A5’ layout to calculate margins with the paper size still ‘A4’.

• A new driver option `xetex`.
The new driver option `xetex` is added. The driver auto-detection routine has been revised so as to avoid an error with undefined control sequences. Note that ‘geometry.cfg’ in TEx Live, which disables the auto-detection routine and sets `pdftex`, is no longer necessary and has no problem even though it still exists. To set `xetex` is strongly recommended with XELATEX.

• New paper size presets for JIS B-series and ISO C-series.
The papersize presets `b0j` to `b6j` for JIS (Japanese Industrial Standards) B-series and `c0paper` to `c6paper` for ISO C-series (v5.4~) are added.

• Changing default for underspecified margin.
In the previous version, if only one margin was specified, `bottom=1cm` for example, then `geometry` set the other margin with the margin ratio (1:1 by default for the vertical dimensions) and got `top=1cm` in this case. The version 5 sets the text-body size with the default `scale` (= 0.7) and determine the unspecified margin. (See Section 6.5)

• The option `showframe` and `showcrop` works on every page.
With `showframe` option, the page frames are shown on every page. In addition, a new option `showcrop` prints crop marks at each corner of layout area on every page. Note that the marks would be invisible without specifying the layout size smaller than paper size. Version 5.4 introduced a new `\shipout` overloading process using `atbegshi` package, so the `atbegshi` package is required when `showframe` or `showcrop` option is specified.

• Loading geometry.cfg precedes processing class options.
The previous version loaded `geometry.cfg` after processing the document class options. Now that the config file is loaded before processing the class options, you can change the behavior specified in `geometry.cfg` by adding options into `\documentclass` as well as `\usepackage` and `\geometry`. 
• **Deleted options:** compat2 and twosideshift. The version 5 has no longer compatibility with the previous ones. compat2 and twosideshift are gone for simplicity.

## 2 Introduction

To set dimensions for page layout in \LaTeX{} is not straightforward. You need to adjust several \LaTeX{} native dimensions to place a text area where you want. If you want to center the text area in the paper you use, for example, you have to specify native dimensions as follows:

\begin{verbatim}
\usepackage{calc}
\setlength{textwidth}{7in}
\setlength{textheight}{10in}
\setlength{oddsidemargin}{(\paperwidth-\textwidth)/2 - 1in}
\setlength{topmargin}{(\paperheight-\textheight -\headheight-\headsep-\footskip)/2 - 1in}.
\end{verbatim}

Without package calc, the above example would need more tedious settings. Package geometry provides an easy way to set page layout parameters. In this case, what you have to do is just

\begin{verbatim}
usepackage[text={7in,10in},centering]{geometry}
\end{verbatim}

Besides centering problem, setting margins from each edge of the paper is also troublesome. But geometry also make it easy. If you want to set each margin to 1.5in, you can type

\begin{verbatim}
usepackage[margin=1.5in]{geometry}
\end{verbatim}

Thus, the geometry package has an auto-completion mechanism, in which unspecified dimensions are automatically determined. The geometry package will be also useful when you have to set page layout obeying the following strict instructions: for example,

*The total allowable width of the text area is 6.5 inches wide by 8.75 inches high. The top margin on each page should be 1.2 inches from the top edge of the page. The left margin should be 0.9 inch from the left edge. The footer with page number should be at the bottom of the text area.*

In this case, using geometry you can type

\begin{verbatim}
usepackage[total={6.5in,8.75in},
            top=1.2in, left=0.9in, includefoot]{geometry}
\end{verbatim}

Setting a text area on the paper in document preparation system has some analogy to placing a window on the background in the window system. The name ‘geometry’ comes from the \texttt{-geometry} option used for specifying a size and location of a window in X Window System.

## 3 Page geometry

Figure 1 shows the page layout dimensions defined in the geometry package. The page layout contains a total body (printable area) and margins. The total body consists of a body (text area) with an optional header, footer and marginal notes (marginpar). There are four margins: left, right, top and bottom. For twosided documents, horizontal margins should be called inner and outer.

- **paper** : total body and margins
- **total body** : body (text area) (optional head, foot and marginpar)
- **margins** : left (inner), right (outer), top and bottom

Each margin is measured from the corresponding edge of a paper. For example, left margin (inner margin) means a horizontal distance between the left (inner) edge of the paper and that of the total body. Therefore the left and top margins defined in geometry are different from the native dimensions \texttt{\leftmargin} and \texttt{\topmargin}. The size of a body (text area) can be modified by \texttt{\textwidth} and \texttt{\textheight}. The dimensions for paper, total body and margins have the following relations.

\begin{align}
\text{paperwidth} &= \text{left} + \text{width} + \text{right} \\
\text{paperheight} &= \text{top} + \text{height} + \text{bottom}
\end{align}
Figure 1: Dimension names used in the geometry package. width = textwidth and height = textheight by default. left, right, top and bottom are margins. If margins on verso pages are swapped by twoside option, margins specified by left and right options are used for the inside and outside margins respectively. inner and outer are aliases of left and right respectively.

Figure 2: includehead and includefoot include the head and foot respectively into total body. (a) height = textheight (default). (b) height = textheight + headheight + headsep + footskip if includehead and includefoot. If the top and bottom margins are specified, includehead and includefoot result in shorter textheight.

The total body width and height would be defined:

\[
\begin{align*}
\text{width} & := \text{textwidth} \ (+ \ \text{marginparsep} \ + \ \text{marginparwidth}) \\
\text{height} & := \text{textheight} \ (+ \ \text{headheight} \ + \ \text{headsep} \ + \ \text{footskip})
\end{align*}
\]

In Equation (3) width:=textwidth by default, while marginparsep and marginparwidth are included in width if includemp option is set true. In Equation (4), height:=textheight by default. If includehead is set to true, headheight and headsep are considered as a part of height. In the same way, includefoot takes footskip into height. Figure 2 shows how these options work in the vertical direction.

Thus, the page layout consists of three parts (lengths) in each direction: one body and two margins. If the two of them are explicitly specified, the other length is obvious and no need to be specified. Figure 3 shows a simple model of page dimensions. When a length L is given and is partitioned into the body b, the margins a and c, it’s obvious that

\[
L = a + b + c
\]

The specification with two of the three (a,b and c) fixed explicitly is solvable. If two or more are left unspecified or ‘underspecified’, Equation (5) cannot be solved without any other relation between them. If all of them are specified, then it needs to check whether or not they satisfy Equation (5), that is too much specification or ‘overspecified’.
The geometry package has auto-completion mechanism that saves the trouble of specifying the page layout dimensions. For example, you can set

\usepackage[width=14cm, left=3cm]{geometry}

on A4 paper. In this case you don’t have to set the right margin. The details of auto-completion will be described in Section 6.5.

4 User interface

4.1 Commands

The geometry package provides the following commands:

- \geometry{⟨options⟩}
- \newgeometry{⟨options⟩} and \restoregeometry
- \savegeometry{⟨name⟩} and \loadgeometry{⟨name⟩}

\geometry{⟨options⟩} changes the page layout according to the options specified in the argument. This command, if any, should be placed only in the preamble (before \begin{document}).

The geometry package may be used as part of a class or another package you use in your document. The command \geometry can overwrite some of the settings in the preamble. Multiple use of \geometry is allowed and then processed with the options concatenated. If geometry is not yet loaded, you can use only \usepackage{⟨options⟩}{geometry} instead of \geometry.

\newgeometry{⟨options⟩} changes the page layout mid-document. \newgeometry is almost similar to \geometry except that \newgeometry disables all the options specified by \usepackage and \geometry in the preamble and skips papersize-related options. \restoregeometry restores the page layout specified in the preamble. This command has no arguments. See Section 7 for details.

\savegeometry{⟨name⟩} saves the page dimensions as ⟨name⟩ where you put this command. \loadgeometry{⟨name⟩} loads the page dimensions saved as ⟨name⟩. See Section 7 for details.

4.2 Optional argument

The geometry package adopts keyval interface ‘⟨key⟩=⟨value⟩’ for the optional argument to \usepackage, \geometry and \newgeometry.

The argument includes a list of comma-separated keyval options and has basic rules as follows:

- Multiple lines are allowed, while blank lines are not.
- Any spaces between words are ignored.
- Options are basically order-independent. (There are some exceptions. See Section 6.2 for details.)

For example,

\usepackage[ a5paper , hmargin = { 3cm, .8in } , height = 10in ]{geometry}

is equivalent to

\usepackage[height=10in,a5paper,hmargin={3cm,0.8in}]{geometry}

Some options are allowed to have sub-list, e.g. {3cm,0.8in}. Note that the order of values in the sub-list is significant. The above setting is also equivalent to the followings:
or
\usepackage[a5paper]{geometry}
\geometry{hmargin={3cm,0.8in},height=8in}
\geometry{height=10in}.

Thus, multiple use of \geometry just appends options. geometry supports package \texttt{calc}\textsuperscript{1}. For example,
\begin{verbatim}
\usepackage{calc}
\usepackage[textheight=20\baselineskip+10pt]{geometry}
\end{verbatim}

4.3 Option types
\texttt{geometry} options are categorized into four types:

1. **Boolean type**
   takes a boolean value (\texttt{true} or \texttt{false}). If no value, \texttt{true} is set by default.
   \begin{verbatim}
   \langle\texttt{key}\rangle=\texttt{true} | \texttt{false}.
   \langle\texttt{key}\rangle \text{ with no value is equivalent to } \langle\texttt{key}\rangle=\texttt{true}.
   \end{verbatim}

   \textit{Examples:} \texttt{verbose=true}, \texttt{includehead}, \texttt{twoside=false}.

2. **Single-valued type**
   takes a mandatory value.
   \begin{verbatim}
   \langle\texttt{key}\rangle=\langle\texttt{value}\rangle.
   \end{verbatim}

   \textit{Examples:} \texttt{width=7in}, \texttt{left=1.25in}, \texttt{footskip=1cm}, \texttt{height=.86\paperheight}.

3. **Double-valued type**
   takes a pair of comma-separated values in braces. The two values can be shortened to one value if they are identical.
   \begin{verbatim}
   \langle\texttt{key}\rangle=\{\langle\texttt{value1}\rangle,\langle\texttt{value2}\rangle\}.
   \langle\texttt{key}\rangle=\langle\texttt{value}\rangle \text{ is equivalent to } \langle\texttt{key}\rangle=\{\langle\texttt{value}\rangle,\langle\texttt{value}\rangle\}.
   \end{verbatim}

   \textit{Examples:} \texttt{hmargin={1.5in,1in}}, \texttt{scale=0.8}, \texttt{body={7in,10in}}.

4. **Triple-valued type**
   takes three mandatory, comma-separated values in braces.
   \begin{verbatim}
   \langle\texttt{key}\rangle=\{\langle\texttt{value1}\rangle,\langle\texttt{value2}\rangle,\langle\texttt{value3}\rangle\}
   \end{verbatim}

   Each value must be a dimension or null. When you give an empty value or ‘\texttt{*}’, it means null and leaves the appropriate value to the auto-completion mechanism. You need to specify at least one dimension, typically two dimensions. You can set nulls for all the values, but it makes no sense. 

   \textit{Examples:} \texttt{hdivide={2cm,*,1cm}}, \texttt{vdivide={3cm,19cm,}}, \texttt{divide={1in,*,1in}}.

5 Option details

This section describes all options available in \texttt{geometry}. Options with a dagger \textsuperscript{†} are not available as arguments of \texttt{\newgeometry} (See Section 7).

\textsuperscript{1}CTAN: \texttt{macros/latex/required/tools}
5.1 Paper size

The options below set paper/media size and orientation.

† paper | papername

specifies the paper size by name. paper=\langle paper-name \rangle. For convenience, you can specify the paper name without paper=. For example, a4paper is equivalent to paper=a4paper.

† a0paper, a1paper, a2paper, a3paper, a4paper, a5paper, a6paper, b0paper, b1paper, b2paper, b3paper, b4paper, b5paper, b6paper, c0paper, c1paper, c2paper, c3paper, c4paper, c5paper, c6paper, b0j, b1j, b2j, b3j, b4j, b5j, b6j, ansiaprimepaper, ansiaprimepaper, ansiaprimepaper, ansiaprimepaper, ansiaprimepaper, letterpaper, executivepaper, legalpaper

specifies paper name. The value part is ignored even if any. For example, the followings have the same effect:

a5paper, a5paper=true, a5paper=false and so forth.

a[0-6]paper, b[0-6]paper and c[0-6]paper are ISO A, B and C series of paper sizes respectively. The JIS (Japanese Industrial Standards) A-series is identical to the ISO A-series, but the JIS B-series is different from the ISO B-series. b[0-6]j should be used for the JIS B-series.

† screen

a special paper size with (W,H) = (225mm,180mm). For presentation with PC and video projector, “screen,centering” with ‘slide’ documentclass would be useful.

† paperwidth

width of the paper. paperwidth=\langle length \rangle.

† paperheight

height of the paper. paperheight=\langle length \rangle.

† papersize

width and height of the paper. papersize=\langle width \rangle, \langle height \rangle or papersize=\langle length \rangle.

† landscape

switches the paper orientation to landscape mode.

† portrait

switches the paper orientation to portrait mode. This is equivalent to landscape=false.

The options for paper names (e.g., a4paper) and orientation (portrait and landscape) can be set as document class options. For example, you can set \documentclass[a4paper,landscape]{article}, then a4paper and landscape are processed in geometry as well. This is also the case for twoside and twocolumn (see also Section 5.5).

5.2 Layout size

You can specify the layout area with options described in this section regardless of the paper size. The options would help to print the specified layout to a different sized paper. For example, with a4paper and layout=a5paper, the package uses ‘A5’ layout to calculate margins on ‘A4’ paper. The layout size defaults to the same as the paper. The options for the layout size are available in \newgeometry, so that you can change the layout size in the middle of the document. The paper size itself can’t be changed though. Figure 4 shows what the difference between layout and paper is.

layout specifies the layout size by paper name. layout=\langle paper-name \rangle. All the paper names defined in geometry are available. See Section 5.1 for details.

layoutwidth width of the layout. layoutwidth=\langle length \rangle.

layoutheight height of the layout. layoutheight=\langle length \rangle.

layoutsizewidth and height of the layout. layoutsize=\langle width \rangle, \langle height \rangle or layoutsize=\langle length \rangle.

layoutoffset specifies the horizontal offset from the left edge of the paper. layoutoffset=\langle length \rangle.

layoutvoffset specifies the vertical offset from the top edge of the paper. layoutvoffset=\langle length \rangle.

layoutoffset specifies both horizontal and vertical offsets. layoutoffset=\langle (hoffset), (voffset) \rangle or layoutoffset=\langle (length) \rangle.

5.3 Body size

The options specifying the size of total body are described in this section.

hscale ratio of width of total body to \paperwidth. hscale=\langle h-scale \rangle, e.g., hscale=0.8 is equivalent to width=0.8\paperwidth. (0.7 by default)
Figure 4: The dimensions related to the layout size. Note that the layout size defaults to the same size as the paper, so you don’t have to specify layout-related options explicitly in most cases.

vscale \[\text{ratio of height of total body to paperheight, e.g., vscale=(v-scale). (0.7 by default)}\]

scale \[\text{ratio of total body to the paper. scale=(\langle h-scale \rangle, \langle v-scale \rangle) or scale=(\langle scale \rangle). (0.7 by default)}\]

width | totalwidth \[\text{width of total body. width=\langle length \rangle or totalwidth=\langle length \rangle. This dimension defaults to textwidth, but if includemp is set to true, width \geq textwidth because width includes the width of the marginal notes. If textwidth and width are specified at the same time, textwidth takes priority over width.}\]

height | totalheight \[\text{height of total body, excluding header and footer by default. If includehead or includefoot is set, height includes the head or foot of the page as well as textheight. height=\langle length \rangle or totalheight=\langle length \rangle. If both textheight and height are specified, height will be ignored.}\]

total \[\text{width and height of total body. total=\langle \langle width \rangle, \langle height \rangle \rangle or total=\langle length \rangle.}\]

textheight \[\text{specifies \textwidth, the width of body (the text area). textheight=\langle length \rangle.}\]

textwidth \[\text{specifies \textwidth, the height of body (the text area). textheight=\langle length \rangle.}\]

body \[\text{specifies both \textwidth and \textheight of the body of page. body=\langle \langle width \rangle, \langle height \rangle \rangle or text=\langle length \rangle.}\]

lines \[\text{enables users to specify \textheight by the number of lines. lines=\langle integer \rangle.}\]

includehead \[\text{includes the head of the page, headheight and headsep, into total body. It is set to false by default. It is opposite to ignorehead. See Figure 2 and Figure 5.}\]

includefoot \[\text{includes the foot of the page, footskip, into total body. It is opposite to ignorefoot. It is false by default. See Figure 2 and Figure 5.}\]

includeheadfoot \[\text{sets both includehead and includefoot to true, which is opposite to ignoreheadfoot. See Figure 2 and Figure 5.}\]

includemp \[\text{includes the margin notes, marginparwidth and marginparsep, into body when calculating horizontal calculation.}\]

includeall \[\text{sets both includeheadfoot and includemp to true. See Figure 5.}\]

ignorehead \[\text{disregards the head of the page, headheight and headsep, in determining vertical layout, but does not change those lengths. It is equivalent to includehead=false. It is set to true by default. See also includehead.}\]

ignorefoot \[\text{disregards the foot of page, footskip, in determining vertical layout, but does not change that length. This option defaults to true. See also includefoot.}\]

ignoreheadfoot \[\text{sets both ignorehead and ignorefoot to true. See also includeheadfoot.}\]
Figure 5: Sample layouts for total body with different switches. (a) includeheadfoot, (b) includeall, (c) includefoot and (d) includefoot, includemp. If reversemp is set to true, the location of the marginal notes are swapped on every page. Option twoside swaps both margins and marginal notes on verso pages. Note that the marginal note, if any, is printed despite ignoremp or includemp=false and overrun the page in some cases.

ignoremp disregards the marginal notes in determining the horizontal margins (defaults to true). If marginal notes overrun the page, the warning message will be displayed when verbose=true. See also includemp and Figure 5.

ignoreall sets both ignoreheadfoot and ignoremp to true. See also includeall.

heightrounded
This option rounds \textheight to n-times (n: an integer) of \baselineskip plus \topskip to avoid “underfull vbox” in some cases. For example, if \textheight is 486pt with \baselineskip 12pt and \topskip 10pt, then

\[ (39 \times 12pt + 10pt =) \ 478pt < 486pt < 490pt \ (= 40 \times 12pt + 10pt), \]

as a result \textheight is rounded to 490pt. heightrounded=false by default.

Figure 5 illustrates various layouts with different layout modes. The dimensions for a header and a footer can be controlled by nohead or nofoot mode, which sets each length to 0pt directly. On the other hand, options with the prefix ignore do not change the corresponding native dimensions.

The following options can specify body and margins simultaneously with three comma-separated values in braces.

hdivide horizontal partitions (left, width, right). hdivide={⟨left margin⟩, ⟨width⟩, ⟨right margin⟩}. Note that you should not specify all of the three parameters. The best way of using this option is to specify two of three and leave the rest with null(none) or ‘*’.
For example, when you set hdivide={2cm,15cm, }, the margin from the right-side edge of page will be determined calculating paperwidth-2cm-15cm.
5.4 Margin size

The options specifying the size of the margins are listed below.

- **left** | **lmargin** | **inner**
  - Left margin (for oneside) or inner margin (for twoside) of total body. In other words, the distance between the left (inner) edge of the paper and that of total body. `left=⟨length⟩`. `inner` has no special meaning, just an alias of `left` and `lmargin`.

- **right** | **rmargin** | **outer**
  - Right margin or outer margin of total body. `right=⟨length⟩`.

- **top** | **tmargin**
  - Top margin of the page. `top=⟨length⟩`. Note this option has nothing to do with the native dimension \textbackslash topmargin.

- **bottom** | **bmargin**
  - Bottom margin of the page. `bottom=⟨length⟩`.

- **hmargin**
  - Left and right margin. `hmargin=⟨left margin⟩,⟨right margin⟩` or `hmargin=⟨length⟩`.

- **vmargin**
  - Top and bottom margin. `vmargin=⟨top margin⟩,⟨bottom margin⟩` or `vmargin=⟨length⟩`.

- **margin**
  - `margin=⟨A,B⟩` is equivalent to `hmargin=⟨A,B⟩` and `vmargin=⟨A,B⟩`. `margin=⟨A⟩` is automatically expanded to `hmargin=⟨A⟩` and `vmargin=⟨A⟩`.

- **hmarginratio**
  - Vertical margin ratio of left (inner) to right (outer). The value of ⟨ratio⟩ should be specified with colon-separated two values. Each value should be a positive integer less than 100 to prevent arithmetic overflow, e.g., 2:3 instead of 1:1.5. The default ratio is 1:1 for oneside, 2:3 for twoside.

- **vmarginratio**
  - Vertical margin ratio of top to bottom. The default ratio is 2:3.

- **marginratio**
  - Horizontal and vertical margin ratios. `marginratio=⟨horizontal ratio⟩,⟨vertical ratio⟩` or `marginratio=⟨ratio⟩`.

- **hcentering**
  - Sets auto-centering horizontally and is equivalent to `hmarginratio=1:1`. It is set to true by default for oneside. See also `hmarginratio`.

- **vcentering**
  - Sets auto-centering vertically and is equivalent to `vmarginratio=1:1`. The default is false. See also `vmarginratio`.

- **centering**
  - Sets auto-centering and is equivalent to `marginratio=1:1`. See also `marginratio`. The default is false. See also `marginratio`.

- **twoside**
  - Switches on twoside mode with left and right margins swapped on verso pages. The option sets \textbackslash twoside and \textbackslash mparswitch switches. See also `asymmetric`.

- **asymmetric**
  - Implements a twosided layout in which margins are not swapped on alternate pages (by setting \textbackslash oddsidemargin to \textbackslash evensidemargin + \textbackslash bindingoffset) and in which the marginal notes stay always on the same side. This option can be used as an alternative to the twoside option. See also `twoside`.

- **bindingoffset**
  - Removes a specified space from the lefthand-side of the page for oneside or the inner-side for twoside. `bindingoffset=⟨length⟩`. This is useful if pages are bound by a press binding (glued, stitched, stapled ...). See Figure 6.

- **hdivide**
  - See description in Section 5.3.

- **vdivide**
  - See description in Section 5.3.

- **divide**
  - See description in Section 5.3.

5.5 Native dimensions

The options below overwrite \LaTeX native dimensions and switches for page layout (See the right-hand side in Figure 1).
Figure 6: The option \textit{bindingoffset} adds the specified length to the inner margin. Note that \texttt{twoside} option swaps the horizontal margins and the marginal notes together with \texttt{bindingoffset} on even pages (see b), but \texttt{asymmetric} option suppresses the swap of the margins and marginal notes (but \texttt{bindingoffset} is still swapped).

\begin{itemize}
  \item \texttt{headheight} | \texttt{head} modifies \texttt{\headheight}, height of header. \texttt{headheight}=(\texttt{length}) or \texttt{head}=(\texttt{length}).
  \item \texttt{headsep} modifies \texttt{\headsep}, separation between header and text (body). \texttt{headsep}=(\texttt{length}).
  \item \texttt{footskip} | \texttt{foot} modifies \texttt{\footskip}, distance separation between baseline of last line of text and baseline of footer. \texttt{footskip}=(\texttt{length}) or \texttt{foot}=(\texttt{length}).
  \item \texttt{nohead} eliminates spaces for the head of the page, which is equivalent to both \texttt{\headheight}=0pt and \texttt{\headsep}=0pt.
  \item \texttt{nofoot} eliminates spaces for the foot of the page, which is equivalent to \texttt{\footskip}=0pt.
  \item \texttt{noheadfoot} equivalent to \texttt{nohead} and \texttt{nofoot}, which means that \texttt{\headheight}, \texttt{\headsep} and \texttt{\footskip} are all set to 0pt.
  \item \texttt{footnotesep} changes the dimension \texttt{\skip\footins}, separation between the bottom of text body and the top of footnote text.
  \item \texttt{marginparwidth} | \texttt{marginpar} modifies \texttt{\marginparwidth}, width of the marginal notes. \texttt{marginparwidth}=(\texttt{length}).
  \item \texttt{marginparsep} modifies \texttt{\marginparsep}, separation between body and marginal notes. \texttt{marginparsep}=(\texttt{length}).
  \item \texttt{nomarginpar} shrinks spaces for marginal notes to 0pt, which is equivalent to \texttt{\marginparwidth}=0pt and \texttt{\marginparsep}=0pt.
  \item \texttt{columnsep} modifies \texttt{\columnsep}, the separation between two columns in \texttt{twocolumn} mode.
  \item \texttt{hoffset} modifies \texttt{\hoffset}. \texttt{hoffset}=(\texttt{length}).
  \item \texttt{voffset} modifies \texttt{\voffset}. \texttt{voffset}=(\texttt{length}).
  \item \texttt{offset} horizontal and vertical offset. \texttt{offset}=(\texttt{hoffset},\texttt{voffset}) or \texttt{offset}=(\texttt{length}).
  \item \texttt{twocolumn} sets \texttt{twocolumn} mode with \texttt{@twocolumntrue}. \texttt{twocolumn}=\texttt{false} denotes onecolumn mode with \texttt{@twocolumnfalse}. Instead of \texttt{twocolumn}=\texttt{false}, you can specify \texttt{onecolumn} (which defaults to \texttt{true})
  \item \texttt{onecolumn} works as \texttt{twocolumn}=\texttt{false}. On the other hand, \texttt{onecolumn}=\texttt{false} is equivalent to \texttt{twocolumn}.
  \item \texttt{twoside} sets both \texttt{@twosidetrue} and \texttt{@mparswitchtrue}. See Section 5.4.
  \item \texttt{textwidth} sets \texttt{\textwidth} directly. See Section 5.3.
  \item \texttt{textheight} sets \texttt{\textheight} directly. See Section 5.3.
  \item \texttt{reversemargins} makes the marginal notes appear in the left (inner) margin with \texttt{@reversemargintrue}. The option doesn’t change \texttt{includemp} mode. It’s set \texttt{false} by default.
\end{itemize}
5.6 Drivers

The package supports drivers dvips, dvipdfm, pdftex, luatex, xetex and vtex. You can also set dvipdfmx and xdvipdfmx, pdftex for pdflatex, and vtex for VTEX environment. The driver options are exclusive. The driver can be set by either driver=(driver name) or any of the drivers directly like pdftex. By default, geometry guesses the driver appropriate to the system in use. Therefore, you don’t have to set a driver in most cases. However, if you want to use dvipdfm, you should specify it explicitly.

† driver specifies the driver with driver=(driver name). dvips, dvipdfm, pdftex, vtex, xetex, auto and none are available as a driver name. The names except for auto and none can be specified directly with the name without driver=. driver=auto makes the auto-detection work whatever the previous setting is. driver=none disables the auto-detection and sets no driver, which may be useful when you want to let other package work out the driver setting. For example, if you want to use crop package with geometry, you should call \usepackage[driver=none]{geometry} before the crop package.

† dvips writes the paper size in dvi output with the \special macro. If you use dvips as a DVI-to-PS driver, for example, to print a document with \geometry{a3paper,landscape} on A3 paper in landscape orientation, you don’t need options “-t a3 -t landscape” to dvips.

† dvipdfm works like dvips except for landscape correction. You can set this option when using dvipdfmx and xdvipdfmx to process the dvi output.

† pdftex sets \pdfpagewidth and \pdfpageheight internally.

† xetex is the same as pdftex except for ignoring \pdf{h,v}origin undefined in X\LaTeX. This option is introduced in the version 5. Note that ‘geometry.cfg’ in T\EX Live, which disables the auto-detection routine and sets pdftex, is no longer necessary, but has no problem even though it’s left undeleted. Instead of xetex, you can specify dvipdfm with X\LaTeX supports.

† vtex sets dimensions \mediawidth and \mediaheight for V\LaTeX. When this driver is selected (explicitly or automatically), geometry will auto-detect which output mode (DVI, PDF or PS) is selected in V\LaTeX, and do proper settings for it.

If explicit driver setting is mismatched with the typesetting program in use, the default driver dvips would be selected.

5.7 Other options

The other useful options are described here.

† verbose displays the parameter results on the terminal. verbose=false (default) still puts them into the log file.

† reset sets back the layout dimensions and switches to the settings before geometry is loaded. Options given in geometry.cfg are also cleared. Note that this cannot reset pass and mag with truedimen. reset=false has no effect and cannot cancel the previous reset=true if any. For example, when you go

\documentclass[landscape]{article} 
\usepackage[twoside,reset,left=2cm]{geometry}

with \ExecuteOptions{scale=0.9} in geometry.cfg, then as a result, landscape and left=2cm remain effective, and scale=0.9 and twoside are ineffective.

† mag sets magnification value (\mag) and automatically modifies \hoffset and \voffset according to the magnification. mag=(value). Note that (value) should be an integer value with 1000 as a normal size. For example, mag=1414 with a4paper provides an enlarged print fitting in a3paper, which is 1.414 (=\sqrt{2}) times larger than a4paper. Font enlargement needs extra disk space. Note that setting mag should precede any other settings with ‘true’ dimensions, such as 1.truein, 2truecm and so on. See also truedimen option.
† truedimen changes all internal explicit dimension values into true dimensions, e.g., 1in is changed to 1truein. Typically this option will be used together with mag option. Note that this is ineffective against externally specified dimensions. For example, when you set "mag=1440, margin=10pt, truedimen", margins are not ‘true’ but magnified. If you want to set exact margins, you should set like "mag=1440, margin=10truept, truedimen" instead.

† pass disables all of the geometry options and calculations except verbose and showframe. It is order-independent and can be used for checking out the page layout of the documentclass, other packages and manual settings without geometry.

† showframe shows visible frames for the text area and page, and the lines for the head and foot on the first page.

† showcrop prints crop marks at each corner of user-specified layout area.

6 Processing options

6.1 Order of loading

If there’s geometry.cfg somewhere \TeX can find it, geometry loads it first. For example, in geometry.cfg you may write \ExecuteOptions{a4paper}, which specifies A4 paper as the default paper. Basically you can use all the options defined in geometry with \ExecuteOptions{}.

The order of loading in the preamble of your document is as follows:

1. geometry.cfg if it exists.
2. Options specified with \documentclass[⟨options⟩]{...}.
3. Options specified with \usepackage[⟨options⟩]{geometry}
4. Options specified with \geometry{⟨options⟩}, which can be called multiple times. (reset option will cancel the specified options ever given in \usepackage{geometry} or \geometry.)

6.2 Order of options

The specification of geometry options is order-independent, and overwrites the previous one for the same setting. For example,

[left=2cm, right=3cm] is equivalent to [right=3cm, left=2cm].

The options called multiple times overwrite the previous settings. For example,

[verbose=true, verbose=false] results in verbose=false.

[hmargin={3cm,2cm}, left=1cm] is the same as hmargin={1cm,2cm}, where the left (or inner) margin is overwritten by left=1cm.

reset and mag are exceptions. The reset option removes all the geometry options (except pass) before it. If you set

\documentclass[landscape]{article}
\usepackage[margin=1cm,twoside]{geometry}
\geometry{a5paper, reset, left=2cm}

then margin=1cm, twoside and a5paper are removed, and is eventually equivalent to

\documentclass[landscape]{article}
\usepackage[left=2cm]{geometry}

The mag option should be set in advance of any other settings with ‘true’ length, such as left=1.5truecm, width=5truein and so on. The \mag primitive can be set before this package is called.
6.3 Priority

There are several ways to set dimensions of the \textit{body}: \scale, \textit{total}, \textit{text} and \textit{lines}. The \texttt{geometry} package gives higher priority to the more concrete specification. Here is the priority rule for \textit{body}.

\[
\text{priority: low} \rightarrow \text{high}
\]

\[
\begin{align*}
\hscale &< \textwidth \\
\vscale &< \textheight \\
\scale &< \text
\end{align*}
\]

For example,

\begin{verbatim}
\usepackage[hscale=0.8, textwidth=7in, width=18cm]{geometry}
\end{verbatim}

is the same as \begin{verbatim}\usepackage[textwidth=7in]{geometry}\end{verbatim}. Another example:

\begin{verbatim}
\usepackage[lines=30, scale=0.8, text=7in]{geometry}
\end{verbatim}

results in \begin{verbatim}[lines=30, textwidth=7in]\end{verbatim}.

6.4 Defaults

This section sums up the default settings for the auto-completion described later.

The default vertical margin ratio is \(2/3\), namely,

\[
top : bottom = 2 : 3 \quad \text{default.} \quad (6)
\]

As for the horizontal margin ratio, the default value depends on whether the document is onesided or twosided,

\[
\left.\begin{array}{l}
\text{left (inner)} : \text{right (outer)} = \left.\begin{array}{c}
1 : 1 \quad \text{default for oneside,} \\
2 : 3 \quad \text{default for twoside.}
\end{array}\right. \\
\end{array}\right. \quad (7)
\]

Obviously the default horizontal margin ratio for oneside is ‘centering’.

The \texttt{geometry} package has the following default setting for \texttt{onesided} documents:

- \texttt{scale=0.7} (\textit{body} is \(0.7 \times \texttt{paper}\))
- \texttt{marginratio}=('1:1', '2:3') (1:1 for horizontal and 2:3 for vertical margins)
- \texttt{ignoreall} (the header, footer, marginal notes are excluded when calculating the size of \textit{body}.)

For \texttt{twosided} document with \texttt{twoside} option, the default setting is the same as \texttt{onesided} except that the horizontal margin ratio is set to 2:3 as well.

Additional options overwrite the previous specified dimensions.

6.5 Auto-completion

Figure 7 shows schematically how many specification patterns exist and how to solve the ambiguity of the specifications. Each axis shows the numbers of lengths explicitly specified for body and margins. \(S(m,b)\) presents the specification with a set of numbers \((\text{margin, body}) = (m, b)\).

For example, the specification \texttt{width=14cm, left=3cm} is categorized into \(S(1,1)\), which is an adequate specification. If you add \texttt{right=4cm}, it would be in \(S(2,1)\) and overspecified. If only \texttt{width=14cm} is given, it’s in \(S(0,1)\), underspecified.

The \texttt{geometry} package has the auto-completion mechanism, in which if the layout parameters are underspecified or overspecified, \texttt{geometry} works out the ambiguity using the defaults and other relations. Here are the specifications and the completion rules.

- \(S(0,0)\) Nothing is specified. The \texttt{geometry} package sets \textit{body} with the default \texttt{scale} (= 0.7).
  For example, \texttt{width} is set to be \(0.7 \times \texttt{layoutwidth}\). Note that by default \texttt{layoutwidth} and \texttt{layoutheight} will be equal to \texttt{paperwidth} and \texttt{paperheight} respectively. Thus \(S(0,0)\) goes to \(S(0,1)\). See \(S(0,1)\).
Figure 7: Specifications $S(0,0)$ to $S(2,1)$ and the completion rules (arrows). Column and row numbers denote the number of explicitly specified lengths for margin and body respectively. $S(m,b)$ denote a specification with a set of the numbers $(margin, body) = (m, b)$.

$S(0,1)$ Only body is specified, such as width=7in, lines=20, body={20cm,24cm}, scale=0.9 and so forth. Then geometry sets margins with the margin ratio. If the margin ratio is not specified, the default is used. The default vertical margin ratio is defined as $top : bottom = 2 : 3$ default.  

\[ \text{top} : \text{bottom} = 2 : 3 \quad \text{default.} \quad (8) \]

As for the horizontal margin ratio, the default value depends on whether the document is onesided or twosided,

\[ \text{left (inner)} : \text{right (outer)} = \begin{cases} 1 : 1 & \text{default for oneside,} \\ 2 : 3 & \text{default for twoside.} \end{cases} \quad (9) \]

For example, if height=22cm is specified on A4 paper, geometry calculates top margin as follows:

\[ \text{top} = (\text{layoutheight} - \text{height}) \times 2/5 \]
\[ = (29.7 - 22) \times 2/5 = 3.08(\text{cm}) \quad (10) \]

Thus top margin and body height have been determined, the specification for the vertical goes to $S(1,1)$ and all the parameters can be solved.

$S(1,0)$ Only one margin is specified, such as bottom=2cm, left=1in, top=3cm, and so forth.

- **If the margin ratio is not specified**, geometry sets body with the default scale ($= 0.7$). For example, if top=2.4cm is specified, geometry sets

\[ \text{height} = 0.7 \times \text{layoutheight} \quad (= 0.7 \\text{paperheight} \text{ by default}), \]

then $S(1,0)$ goes to $S(1,1)$, in which bottom is calculated with

\[ \text{layoutheight} - (\text{height} + \text{top}) \]
and results in 6.51cm on A4 paper if the layout size is equal to the paper size.

- **If the margin ratio is specified**, such as hmarginratio={1:2}, vratio={3:4} and so forth, geometry sets the other margin with the specified margin ratio. For example, if a set of options "top=2.4cm,vratio={3:4}" is specified, geometry sets bottom to be 3.2cm calculating

\[ \text{bottom} = \text{top} / 3 \times 4 = 3.2 \text{cm} \]

Thus $S(1,0)$ goes to $S(2,0)$.

Note that the version 4 or earlier used to set the other margin with the margin ratio. In the version 5, therefore, with the same specification, the result will be different from the one in the version 4. For example, if only top=2.4cm is specified, you got bottom=2.4cm in the version 4 or earlier, but you will get bottom=6.51cm in the version 5.
The body and two margins are all specified, such as \divide={1in,8in,1.5in}, “left=3cm,width=13cm,right=4cm” and so forth. Since geometry basically gives priority to margins if dimensions are overspecified, geometry forgets and resets body. For example, if you specify
\usepackage[a4paper,left=3cm,width=13cm,right=4cm]{geometry},
width is reset to be 14cm because the width of a A4 paper is 21cm long.

7 Changing layout mid-document

The version 5 provides the new commands \newgeometry{···} and \restoregeometry, which allow you to change page dimensions in the middle of the document. Unlike \geometry in the preamble, \newgeometry is available only after \begin{document}, resets all the options ever specified except for the papersize-related options: landscape, portrait, and paper size options (such as \papersize, \paper=a4paper and so forth), which can’t be changed with \newgeometry.

The command \restoregeometry restores the page layout specified in the preamble (before \begin{document}) with the options to \usepackage{geometry} and \geometry.

Note that both \newgeometry and \restoregeometry insert \clearpage where they are called.

Below is an example of changing layout mid-document. The layout L1 specified with hmargin=3cm (left and right margins are 3cm long) is changed to L2 with left=3cm, right=1cm and bottom=0.1cm. The layout L1 is restored with \restoregeometry.

\usepackage[hmargin=3cm]{geometry}
\begin{document}
L1
\newgeometry{left=3cm,right=1cm,bottom=0.1cm}
L2 (new)
\restoregeometry
L1 (restored)
\newgeometry{margin=1cm,includefoot}
L3 (new)
\end{document}
8 Examples

1. A onesided page layout with the text area centered in the paper. The examples below have the same result because the horizontal margin ratio is set 1:1 for oneside by default.
   - centering
   - marginratio=1:1
   - vcentering

2. A twosided page layout with the inside offset for binding set to 1cm.
   - twoside, bindingoffset=1cm

   In this case, textwidth is shorter than that of the default twosided document by $0.7 \times 1cm (= 0.7cm)$ because the default width of body is set with scale=0.7, which means width = $0.7 \times layoutwidth (= 0.7 \times \text{paperwidth}$ by default).

3. A layout with the left, right, and top margin 3cm, 2cm and 2.5in respectively, with textheight of 40 lines, and with the head and foot of the page included in total body. The two examples below have the same result.
   - left=3cm, right=2cm, lines=40, top=2.5in, includeheadfoot
   - hmargin={3cm,2cm}, tmargin=2.5in, lines=40, includeheadfoot

4. A layout with the height of total body 10in, the bottom margin 2cm, and the default width. The top margin will be calculated automatically. Each solution below results in the same page layout.
   - vdivide={*, 10in, 2cm}
   - bmargin=2cm, height=10in
   - bottom=2cm, textheight=10in

   Note that dimensions for head and foot are excluded from height of total body. An additional includefoot makes \footskip included in totalheight. Therefore, in the two cases below, textheight in the former layout is shorter than the latter (with 10in exactly) by \footskip. In other words, height = textheight + footskip when includefoot=true in this case.
   - bmargin=2cm, height=10in, includefoot
   - bottom=2cm, textheight=10in, includefoot

5. A layout with textwidth and textheight 90% of the paper and with body centered. Each solution below results in the same page layout as long as layoutwidth and layoutheight are not modified from the default.
   - scale=0.9, centering
   - text={.9\paperwidth,.9\paperheight}, ratio=1:1
   - width=.9\paperwidth, vmargin=.05\paperheight, marginratio=1:1
   - hdivide={*,0.9\paperwidth,*}, vdivide={*,0.9\paperheight,*} (as for onesided documents)
   - margin={0.05\paperwidth,0.05\paperheight}

   You can add heightrounded to avoid an “underfull vbox warning” like

   Underfull \vbox (badness 10000) has occurred while \output is active.
6. A layout with the width of marginal notes set to 3cm and included in the width of total body. The following examples are the same.

- marginparwidth=3cm, includemp
- marginpar=3cm, ignoremp=false

7. A layout where body occupies the whole paper with A5 paper in landscape. The following examples are the same.

- a5paper, landscape, scale=1.0
- landscape=TRUE, paper=a5paper, margin=0pt

8. A screen size layout appropriate for presentation with PC and video projector.

\documentclass{slide}
\usepackage[screen,margin=0.8in]{geometry}
...
\begin{slide}
...
\end{slide}

9. A layout with fonts and spaces both enlarged from A4 to A3. In the case below, the resulting paper size is A3.

- a4paper, mag=1414.

If you want to have a layout with two times bigger fonts, but without changing paper size, you can type

- letterpaper, mag=2000, truedimen.

You can add dvips option, that is useful to preview it with proper paper size by dviout or xdvi.

10. Changing the layout of the first page and leaving the others as default before loading geometry. Use pass option, \newgeometry and \restoregeometry.

\documentclass{book}
\usepackage[pass]{geometry}
\% 'pass' disregards the package layout,
\% so the original 'book' layout is memorized here.
\begin{document}
\newgeometry{margin=1cm}\% changes the first page dimensions.
\begin{document}
\end{document}
\restoregeometry % restores the original 'book' layout.
Page 1
Page 2 and more
\end{document}

11. A complex page layout.

\usepackage[a5paper, landscape, twocolumn, twoside, left=2cm, hmarginratio=2:1, includemp, marginparwidth=43pt, bottom=1cm, foot=.7cm, includefoot, textheight=11cm, heightrounded, columnsep=1cm, dvips, verbose]{geometry}

Try typesetting it and checking out the result yourself. :-)

9 Known problems

- With mag ≠ 1000 and truedimen, paperwidth and paperheight shown in verbose mode are different from the real size of the resulted PDF. The PDF itself is correct anyway.

- With mag ≠ 1000, no truedimen and hyperref, hyperref should be loaded before geometry. Otherwise the resulted PDF size will become wrong.

- With crop package and mag ≠ 1000, center option of crop doesn’t work well.

\define@key{Gm}{executivepaper}[true]{\Gm@setpaper@ifpre{executivepaper}}
\define@key{Gm}{screen}[true]{\Gm@setpaper@ifpre{screen}}
\end{verbatim}

\textit{paper} takes a paper name as its value.
Direct specification for paper size is also possible.

```
\define@key{Gm}{paperwidth}{\ifGm@preamble{paperwidth}{\Gm@setlength\paperwidth{#1}}}%
\define@key{Gm}{paperheight}{\ifGm@preamble{paperheight}{\Gm@setlength\paperheight{#1}}}%
\define@key{Gm}{papersize}{\ifGm@preamble{papersize}{\Gm@branch{#1}{paperwidth}{paperheight}}}%
```

Direct specification for layout size is also possible.

```
\define@key{Gm}{layoutwidth}{\Gm@layouttrue\Gm@setlength\Gm@layoutwidth{#1}}%
\define@key{Gm}{layoutheight}{\Gm@layouttrue\Gm@setlength\Gm@layoutheight{#1}}%
\define@key{Gm}{layoutsize}{\Gm@branch{#1}{layoutwidth}{layoutheight}}%
```

Paper orientation setting.

```
\define@key{Gm}{landscape}{true}{\ifGm@preamble{landscape}{\Gm@doifelse{landscape}{#1}{\Gm@landscapefalse\Gm@reverse{swap@papersize}}}}%
\define@key{Gm}{portrait}{true}{\ifGm@landscape{\Gm@landscapefalse\Gm@reverse{swap@papersize}}}%
```

These options can determine the length(s) of `total body` giving `scale(s)` against the paper size.

```
\define@key{Gm}{hscale}{\Gm@hbodytrue\edef\Gm@hscale{#1}}%
\define@key{Gm}{vscale}{\Gm@vbodytrue\edef\Gm@vscale{#1}}%
\define@key{Gm}{scale}{\Gm@branch{#1}{hscale}{vscale}}%
```

These options give concrete dimension(s) of `total body`. `totalwidth` and `totalheight` are aliases of `width` and `height` respectively.
These options directly sets the dimensions $\textwidth$ and $\textheight$. \textit{body} is an alias of $\text{text}$. These options take the corresponding dimensions as part of \textit{body}. These options exclude \textit{head}, \textit{foot} and \textit{marginpars} when determining \textit{body}. The options set $\textheight$ with the number of lines. The options are useful to specify partitioning in each direction of the paper. These options set \textit{margins}. \textit{left}, \textit{inner}, \textit{innermargin} are aliases of $\text{leftmargin}$. \textit{right}, \textit{outer}, \textit{outermargin} are aliases of $\text{rightmargin}$, top and bottom are aliases of $\text{tmargin}$ and $\text{bmargin}$ respectively.
These options are shorthands for setting `margins`.

Options specifying the margin ratios.

Useful shorthands to place `body` centered.

The direct settings of `head` and/or `foot` dimensions.

They are only shorthands to set `head` and/or `foot` to Opt.

The option directly sets a native dimension `\footnotesep`.

They directly set native dimensions `\marginparwidth` and `\marginparsep`.

The macro is a shorthand for `\marginparwidth=Opt` and `\marginparsep=Opt`.

The option sets a native dimension `\columnsep`.
\hoffset\hoffset and \voffset. offset can set both of them with the same value.

\define@key{Gm}{hoffset}{\Gm@setlength\hoffset{#1}}%
\define@key{Gm}{voffset}{\Gm@setlength\voffset{#1}}%
\define@key{Gm}{offset}{\Gm@branch{#1}{hoffset}{voffset}}%

\layouthoffset\layouthoffset\layoutvoffset\layoutvoffset\layoutoffset\layoutoffset can set both of them with the same value.

\define@key{Gm}{layouthoffset}{\Gm@setlength\Gm@layouthoffset{#1}}%
\define@key{Gm}{layoutvoffset}{\Gm@setlength\Gm@layoutvoffset{#1}}%
\define@key{Gm}{layoutoffset}{\Gm@branch{#1}{layouthoffset}{layoutvoffset}}%

If `\includepdf` is set to `true`, \textwidth and \oddsidemargin are adjusted.
\if\includepdf
  \advance\textwidth-\Gm@wd@mp
  \advance\oddsidemargin\Gm@odd@mp
\fi

Determining \evensidemargin. In the twoside page layout, the right margin value \Gm@rmargin is used. If the marginal note width is included, \evensidemargin should be corrected by \Gm@even@mp.
\if@mparswitch
  \setlength{\evensidemargin}{\Gm@rmargin}\
  \addtolength{\evensidemargin}{-1\Gm@truedimen in}\
  \if\includepdf
    \advance{\evensidemargin}\Gm@even@mp
  \fi
\else
  \evensidemargin=\oddsidemargin
\fi

The bindingoffset correction for \oddsidemargin.
\addtolength{\oddsidemargin}{-\Gm@bindingoffset}\
\addtolength{\topmargin}{-1\Gm@truedimen in}\
\if\includepdf
  \addtolength{\oddsidemargin}{\Gm@even@mp}
\fi

If the head of the page is included in total body, \headheight and \headsep are removed from \textheight, otherwise from \topmargin.
\if\includehead
  \addtolength{\textheight}{-\headheight}\
  \addtolength{\textheight}{-\headsep}
\else
  \addtolength{\topmargin}{-\headheight}\
  \addtolength{\topmargin}{-\headsep}
\fi

If the foot of the page is included in total body, \footskip is removed from \textheight.
\if\includefoot
  \addtolength{\textheight}{-\footskip}
\fi

If \textwidthrounded is set, \textwidth is rounded.
\if\textwidthrounded
  \setlength{\tempdima}{\textheight}\
  \addtolength{\tempdima}{-\topskip}\
  \@tempcnta\tempdima\
  \@tempcntb\baselineskip\
  \divide\@tempcnta\@tempcntb\

  \multiply\tempdimb\@tempcntr\
  \advance\tempdimb\@tempcntr\
  \multiply\tempdimb\tw@\
  \ifdim\tempdimb>\baselineskip
    \addtolength{\tempdimb}{\baselineskip}\
  \fi
  \addtolength{\tempdimb}{\topskip}\
  \setlength{\textheight}{\tempdimb}
\fi

The paper width is set back by adding \Gm@bindingoffset.
\advance\oddsidemargin\Gm@layoutoffset\
\advance\evensidemargin\Gm@layoutoffset\
\advance\topmargin\Gm@layoutoffset\
\addtolength{\Gm@layoutwidth}{\Gm@bindingoffset}\
\end{Gm@@process}

\Gm@detectdriver The macro checks the typeset environment and changes the driver option if necessary. To make the engine detection more robust, the macro is rewritten with packages \ifpdf, \ifvtex and \ifxetex.
\def\Gm@detectdriver{\%
If the driver option is not specified explicitly, then driver auto-detection works.

```latex
\ifpdf
\typeout{*geometry* driver: auto-detecting}\
\ifpdf
\ifpdfextension@undefined
\Gm@setdriver{pdftex}\
\else
\Gm@setdriver{luatex}\
\fi
\else
\Gm@setdriver{dvips}\
\fi
\ifvtex
\Gm@setdriver{vtex}\
\fi
\ifxetex
\Gm@setdriver{xetex}\
\fi
\else
\ifx\Gm@driver<none>\fi
\typeout{*geometry* detected driver: <none>}\
\else
\typeout{*geometry* detected driver: \Gm@driver}\
\fi
\fi
```

\ifpdf is defined in `ifpdf` package in `oberdiek` bundle.

\ifvtex is defined in `ifvtex` package in `oberdiek` bundle.

\ifxetex is defined in `ifxetex` package written by Will Robertson.

When the driver option is set by the user, check if it is valid or not.

```latex
\else
\if\Gm@driver\Gm@xetex \fi
\ifxetex\else
\Gm@warning{Wrong driver setting: 'xetex'; trying 'pdftex' driver}\
\Gm@setdriver{pdftex}\
\fi
\fi
\fi
\fi
```

\ifx\Gm@driver\relax
\typeout{*geometry* detected driver: <none>}\
\else
\typeout{*geometry* detected driver: \Gm@driver}\
\fi
```

\Gm@showparams Prints the resulted parameters and dimensions to STDOUT if `verbose` is true. \Gm@width and \Gm@height are expanded to get the real size.

```latex
\def\Gm@showparams#1{\
\ifGm@verbose\expandafter\typeout\else\expandafter\wlog\fi
{\Gm@logcontent{#1}}}\
\def\Gm@showdim#1{* \string#1=\the#1^^J}\
\def\Gm@showbool#1{\@nameuse{ifGm@#1}#1\space\fi}\
```

\Gm@logcontent The content of geometry parameters and native dimensions for the page layout.

```latex
\def\Gm@logcontent#1{\
*geometry* verbose mode - [ #1 ] result:^^J\
\else
\typeout{*geometry* detected driver: <none>}%\
\else
\typeout{*geometry* detected driver: \Gm@driver}\
\fi
```

```latex
\def\Gm@showparams#1{\
\ifGm@verbose\expandafter\typeout\else\expandafter\wlog\fi
\expandafter\expandafter\expandafter\typeout
\expandafter\expandafter\expandafter{\vlogfi
\expandafter\expandafter\expandafter\typeout}$1$%\
\def\Gm@shovin#1{\string#1=\the$1$%}\n\def\Gm@showbool#1{\@nameuse{ifGm@#1}$1$%}\n\expandafter\expandafter\expandafter\wlogfi
```

```latex
\def\Gm@logcontent#1{\
*geometry* verbose mode - [ #1 ] result:^^J\
\ifGm@pass \expandafter\expandafter\expandafter\typeout
\expandafter\expandafter\expandafter{\vlogfi
\expandafter\expandafter\expandafter\typeout}$1$%\
\else
\typeout{*geometry* detected driver: <none>}%\
\else
\typeout{*geometry* detected driver: \Gm@driver}\
\fi
```

```latex
* driver: \if\Gm@driver<none>\else\Gm@driver\fi^^J\
* paper: \if\Gm@paper\undefined\default\else\Gm@paper\fi^^J\
* layout: \if\Gm@layout\undefined\default\else\Gm@layout\fi^^J\
* layout(offset): (\the\Gm@layoutwidth,\the\Gm@layoutheight)^^J
```

\ProcessOptionsKV
This macro can process class and package options using `key=value` scheme. Only class options are processed with an optional argument ‘c’, package options with ‘p’, and both of them by default.
\def\ProcessOptionsKV{\@ifnextchar{[}{\@ProcessOptionsKV}{\@ProcessOptionsKV[{}]{}}
\def\@ProcessOptionsKV[#1]{\@tempa\@empty\@tempcnta\z@
\if#1p\@tempcnta\@ne\else\if#1c\@tempcnta\tw@\fi\fi\ifodd\@tempcnta
\edef\@tempa{\@ptionlist{\@currname.\@currext}}\else

\edef\@tempa{\noexpand\setkeys{#2}{\@tempa}}\@tempa
\AtEndOfPackage{\let\@unprocessedoptions\relax}}
}}
The original page layout before loading \texttt{geometry} is saved here. \texttt{\Gm@restore@org} is defined here for \texttt{reset} option.

The optional arguments to \texttt{documentclass} are processed here.

Paper dimensions given by class default are stored.

The optional arguments to \texttt{usepackage} are processed here.

Actual settings and calculation for layout dimensions are processed.

The processes for \texttt{verbose}, \texttt{showframe} and drivers are added to \texttt{\AtBeginDocument}. \texttt{\Gm@restore@org} is redefined here with the paper size specified in the preamble for \texttt{\newgeometry} to use it. This should be done before magnifying the paper size with \texttt{\mag} because the layout calculation would be affected by changing the paper size.

Checking the driver options.

If \texttt{xetex} and \texttt{\pdfpagewidth} is defined, \texttt{\pdfpagewidth} and \texttt{\pdfpageheight} would be set.
If pdftex is set to true, pdf-commands are set properly. To avoid pdftex magnification problem, \pdfhorigin and \pdfvorigin are adjusted for \mag.

If luatex is set to true, pdf-commands are set properly. To avoid luatex magnification problem, \horigin and \vorigin are adjusted for \mag.

With VTEX environment, VTEX variables are set here.

If dvips or dvipdfm is specified, paper size is embedded in dvi file with \special. For dvips, a landscape correction is added because a landscape document converted by dvips is upside-down in PostScript viewers.
If dvipdfm is specified and atbegshi package in ‘oberdiek’ bundle is loaded, \AtBeginShipoutFirst is used instead of \AtBeginDvi for compatibility with hyperref and dvipdfm program.

Page frames are shipped out when showframe=true, cropmarks for showcrop=true on each page. The atbegshi package is used for overloading \shipout.

The layout dimensions for \restoregeometry are saved at the end of the \AtBeginDocument.

The macro \geometry can be called multiple times in the preamble (before \begin{document}).

The macro, which can be called from \newgeometry, \restoregeometry and \loadgeometry, changes the layout in the middle of the document.

The macro \newgeometry, which changes the layout, can be used only in the document. It would reset the options specified in the preamble except for paper size options and \mag.
\restoregeometry The macro restores the resulting layout specified in the preamble, namely the first-page layout right after \begin{document}.

\savegeometry The macro saves the layout with the name specified with the argument. The saved layout can be loaded with \loadgeometry{⟨name⟩}.

\loadgeometry The macro loads the layout saved with \savegeometry{⟨name⟩}. If the name is not found, the macro would warn it and do nothing for the layout.

12 Config file

In the configuration file geometry.cfg, one can use \ExecuteOptions to set the site or user default settings.

\loadgeometry{⟨name⟩} % Uncomment and edit the line below to set default options.

13 Sample file

Here is a sample document for the geometry package.
\% \usepackage{geometry}
\% \usepackage{lipsum}
